

# Winning Space Race with Data Science

ABHISHEK SRIRAM 10 April 2024

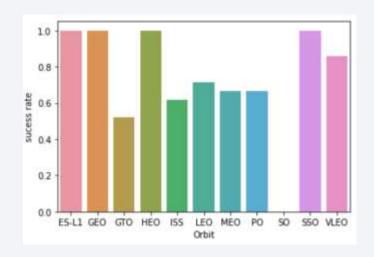

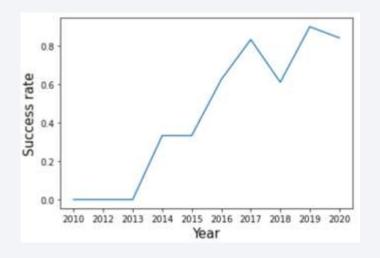

#### Outline

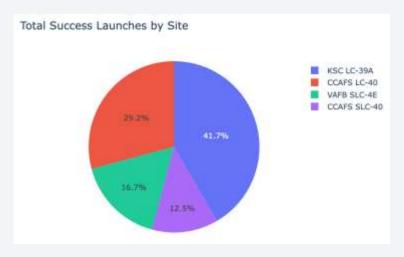

- Executive Summary
- Introduction
- Methodology
- Results
- Conclusion
- Appendix

#### **Executive Summary**

- We use data collection API to get SpaceX Data Sets
- And use exploratory data analysis to analyze data and visualize data
- Use Grid Search method to find the best Machine Learning Model to predict the classification of next landing

#### Introduction

Because SpaceX can reuse the first stage, SpaceX Falcon 9 rocket will launch with a cost of 62 million dollars; whereas other providers sometimes cost upward of 165 million dollars each.

So, if we can determine whether the first stage will land, we can determine the cost of a launch. This information can be used if an alternate company wants to bid against SpaceX for a rocket launch.

- Can we predict a new launch with success of the first stage landing according to the historical launch data?
- Can we tell what is the best choice for a successful launch?

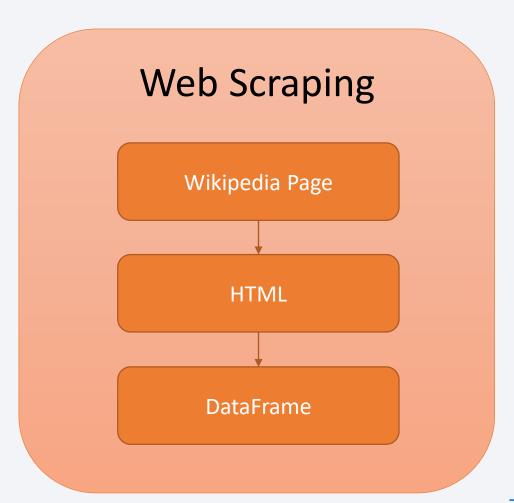

# Methodology

#### **Executive Summary**

- Data collection methodology:
  - SpaceX REST API
  - Web Scraping (Wikipedia)
- Perform data wrangling
  - Generate landing Class from Outcome column
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
  - Using GridSearchCV to find best fit model

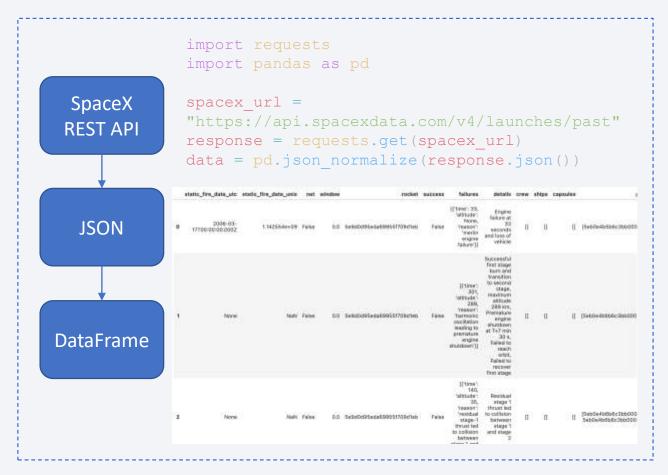

#### **Data Collection**

## Data Collection - SpaceX API

- SpaceX API repository
   https://github.com/r-spacex/SpaceX-API
- Main Endpoint
   https://api.spacexdata.com/v4/launches/past
- My Notebook
   https://github.com/abhishek-sriram/Applied-Data-Science-Capstone

## Data Collection - Scraping

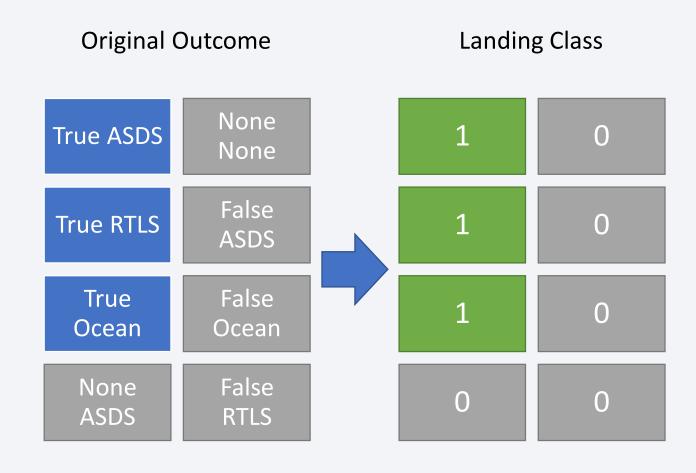

Wikipedia Falcon Page
 https://en.wikipedia.org/wiki/List of Falco
 n 9 and Falcon Heavy launches

My Notebook
 https://github.com/abhishek-sriram/Applied-Data-Science-Capstone-/blob/main/2-jupyter-labs-webscraping.ipynb

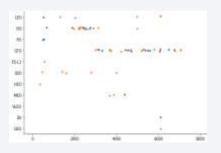

```
import requests
                  from bs4 import BeautifulSoup
                  url =
                  'https://en.wikipedia.org/wiki/List of Falcon
Wikipedia
                   9 and Falcon Heavy launches'
   Page
                  response = requests.get(url)
                  html data = response.text
                  soup = BeautifulSoup(html data)
                  Flight No.
  HTMI
                  Date and<br/>time (<a href="/wiki/Coordinated_Universal_Time" title="Coordin</pre>
                  <a href="/wiki/List_of_Falcon_9_first-stage_boosters" title="List of Falcon</pre>
                   boosters">Version,<br/>br/>Booster</a> <sup class="reference" id="cite_ref-booster_11-0"><a href
                  Launch site
                  Payload<sup class="reference" id="cite_ref-Dragon_12-0"><a href="#cite_note-</a>
DataFrame
                  Payload mass
                  Orbit
                  Customer
                  Launch<br/>outcome
                  <a href="/wiki/Falcon_9_first-stage_landing_tests" title="Falcon 9 first-sta"</pre>
                  tests">Booster<br/>landing</a>
```

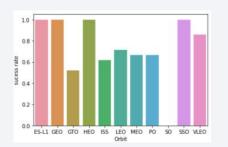

#### Data Wrangling

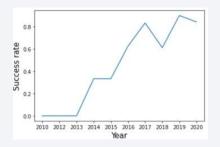

- My Notebook
   https://github.com/abhishek sriram/Applied-Data-Science-Capstone /blob/main/3-jupyter-spacex-data wrangling.ipynb
- Transform raw data to useful data. For example, convert original outcome labels into landing class that represent landing classification which will be our new landing prediction target.
  - 1 for success
  - 0 for failure

#### **EDA** with Data Visualization

My Visualization Notebook
 https://github.com/abhishek sriram/Applied-Data-Science-Capstone /blob/main/5-jupyter-labs-eda dataviz.ipynb

Scatter Plot	To get relationship between variables, e.g.: FlightNumber vs. Orbit type Payload vs. Orbit type FlightNumber vs. PayloadMass FlightNumber vs. Launch Site
Bar Plot	To plot success rate of each orbit
Line Chart	To get the yearly average launch success trend

#### **EDA** with **SQL**

My SQL Notebook

https://github.com/abhisheksriram/Applied-Data-Science-Capstone-/blob/main/4-jupyter-labs-eda-sqlcoursera\_sqllite.ipynb

Launch_Site
CCAFS LC-40
VAFB SLC-4E
KSC LC-39A
CCAFS SLC-40

Booster_Version		
F9 FT B1022		
F9 FT B1026		
F9 FT B1021.2		
F9 FT B1031.2		

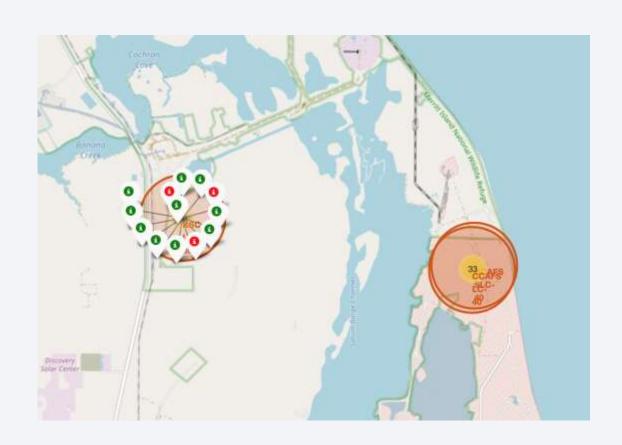

Landing _Outcome	landings
Success	20
No attempt	10
Success (drone ship)	8
Success (ground pad)	6
Failure (drone ship)	4
Failure	3
Controlled (ocean)	3
Failure (parachute)	2
No attempt	1

#### %sql select distinct Launch\_Site from SPACEXTBL

- ✓ Query the names of the **unique launch sites** in the space mission
- ✓ Query the names of the **booster\_versions** which have carried the maximum payload mass.
- ✓ List the total number of **successful** and **failure** mission outcomes
- ✓ List the names of the boosters which have **success in drone ship** and have **payload mass** in some range
- ✓ Rank the count of successful landing\_outcomes in date range in descending order.

#### Build an Interactive Map with Folium

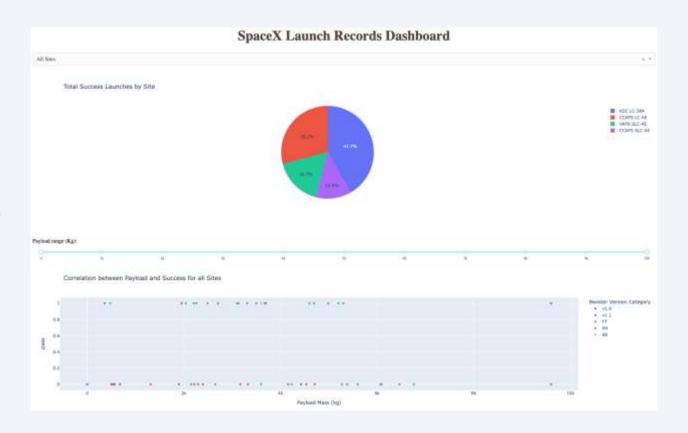

- Add Circles for Launch sites and Markers for labels
- Add MarkerCluster for successful and failed launches
- Add Lines for calculate distance between launch sites and their proximities

#### My Notebook

## Build a Dashboard with Plotly Dash

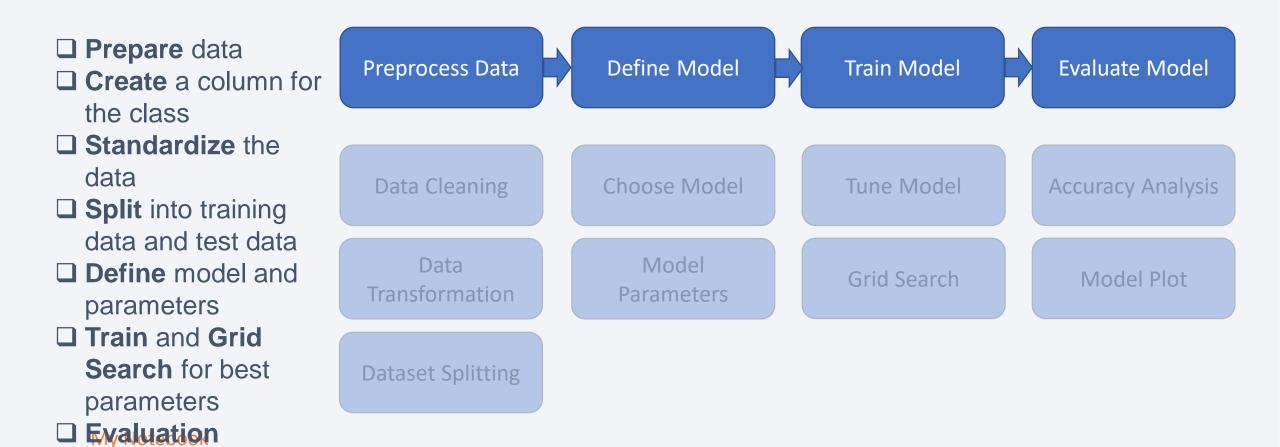

- With a Dropdown menu and a Pie Chart, we can get success launches distribution by launch site
- Additionally, with a Range Slider and a Scatter Plot, we can analyze the correlation between Payload and Success for different launch sites

My Dashboard Python Code

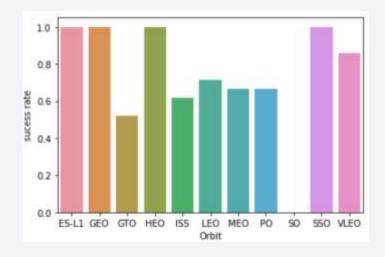

https://github.com/abhishek-sriram/Applied-Data-Science-Capstone-/blob/main/spacex dash app.py

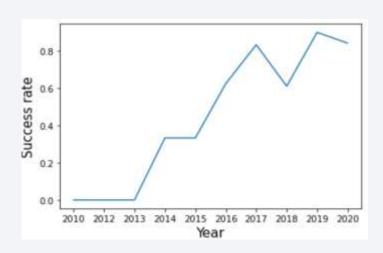

## Predictive Analysis (Classification)

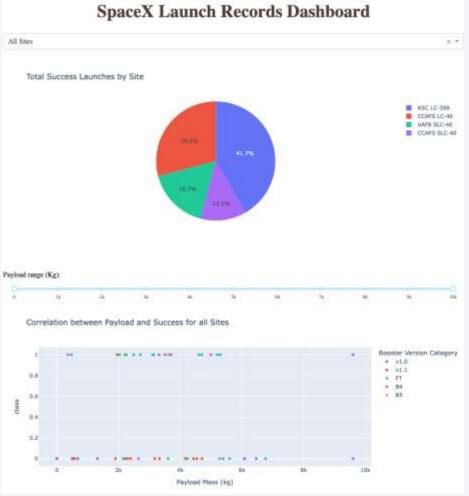

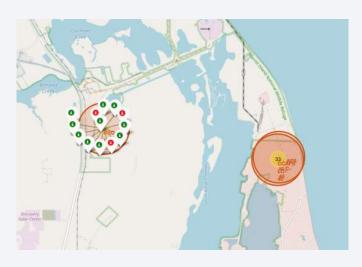

https://github.com/abhishek-sriram/Applied-Data-Science-Capstone-/blob/main/7-SpaceX Machine Learning Prediction Part 5.ipynb

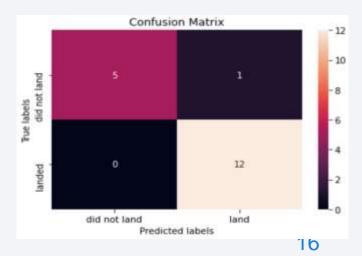

#### Results

## Flight Number vs. Launch Site

```
[4] # Plot a scatter point chart with x axis to be Flight Number and y axis to be the launch site, and hu sns.catplot(y="LaunchSite", x="FlightNumber", hue="Class", data=df, aspect = 5)
plt.xlabel("Flight Number", fontsize=20)
plt.ylabel("LaunchSite", fontsize=20)
plt.show()

CCUPSICE 8

**Flight Number*

**Flight Nu
```

**Explanation**: We can see from the scatter plot that as flight number increases, there are more successful first stage landing. With small flight numbers, launches happens more in the site CCAFS SLC 40 and with much lower success rate. Although there are less launches in VAFB SLC 4E and KSC LC 39A, higher success rate can be seen in these two sites.

#### Payload vs. Launch Site

```
# Plot a scatter point chart with x axis to be Pay Load Mass (kg) and y axis to sns.catplot(y="LaunchSite", x="PayloadMass", hue="Class", data=df, aspect = 5)
plt.xlabel("PayloadMass", fontsize=20)
plt.ylabel("LaunchSite", fontsize=20)
plt.show()

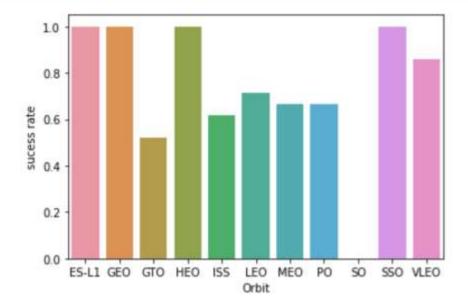

**COMPRICED**

**COMPRICED**
```

**Explanation**: With higher Payload the success rate is much higher. And in KSC LC39A launchsite we can see much higher success rate with low Payload whereas this rate is mucher lower in CCAFS SLC 40 launchsite. Besides, there no rockets launched in VAFB-SLC for Payload greater than 10000. Furthermore, with Payload more than 9500, we can see very high success rate overall.

## Success Rate vs. Orbit Type

```
[ ] sns.barplot(y='Class', x='Orbit', data=df_success_rate)
    plt.xlabel("Orbit", fontsize=10)
    plt.ylabel("sucess rate", fontsize=10)
    plt.show()
```

**Explanation**: From the Bar Plot we can see for Orbit type ES-L1, GEO, HEO, and SSO have the highest success rate, which is 100%. And we also find in SO orbit, the rate is zero.

# Flight Number vs. Orbit Type

```
[9] # Plot a scatter point chart with x axis to be FlightNumber and y axis to be the Orbit, and hue to be
     sns.catplot(y="Orbit", x="FlightNumber", hue="Class", data=df, aspect = 3)
    plt.xlabel("FlightNumber", fontsize=20)
     plt.ylabel("Orbit", fontsize=20)
     plt.show()
        LEO -
         PO
        GTO
        550
        MEO
        VLEO
         50
        GE<sub>0</sub>
                                   20
                                                                            60
                                                       FlightNumber
```

**Explanation**: In ES-L1, GEO, HEO, and SSO orbits, all launches are successful. There is clear relationship between flight number and success rate in LEO orbit since as flightnumber increases, the success rate increases. In contrast, there is no such obvious relationship in GTO orbit.

## Payload vs. Orbit Type

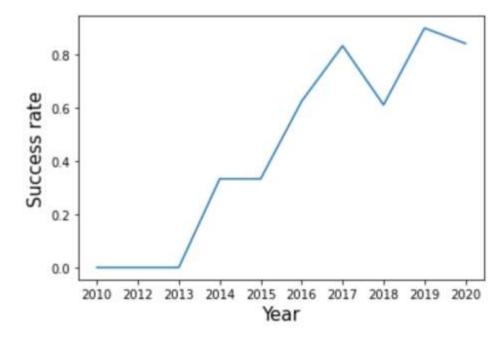

```
[ ] # Plot a scatter point chart with x axis to be Payload and y axis to be the Orbit, and hue to be the class v
     sns.catplot(y="Orbit", x="PayloadMass", hue="Class", data=df, aspect = 3)
     plt.xlabel("PayloadMass", fontsize=20)
     plt.ylabel("Orbit", fontsize=20)
     plt.show()
         LEO
         155
         PO
         GTO
      Orbit
         550
                                                                                                                              Class
         HEO
         MEO
        VLEO
                                                                                                                     .
         50
         GE<sub>0</sub>
                                                                   8000
                                                                                                                        16000
                           2000
                                        4000
                                                      6000
                                                                                10000
                                                                                             12000
                                                                                                           14000
                                                             PayloadMass
```

Explanation: With heavy payloads the successful landing or positive landing rate are more for Polar, LEO and ISS.

However for GTO we cannot distinguish this well as both positive landing rate and negative landing (unsuccessful mission) are both there here.

# Launch Success Yearly Trend

```
[14] sns.lineplot(y='Class', x='Year', data=df_year_success)
    plt.xlabel("Year", fontsize=15)
    plt.ylabel("Success rate", fontsize=15)
    plt.show()
```

Explanation: you can observe that the sucess rate since 2013 kept increasing till 2020

#### All Launch Site Names

#### **Four** Launch Sites:

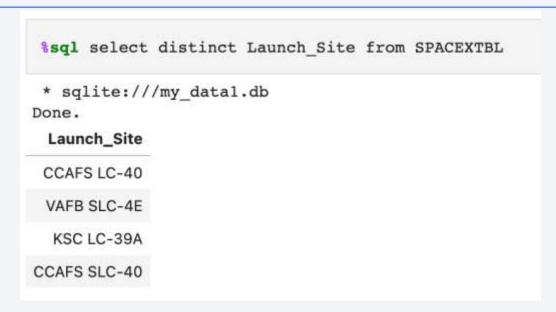

- CCAFS LC-40
- VAFB SLC-4E
- KSC LC-39A
- CCAFS SLC-40

1 in western coast

VAFB SLC-4E

3 in eastern coast

- KSC LC-39A
- CCAFS SLC-40
- CCAFS LC-40

# Launch Site Names Begin with 'CCA'

tsql	select *	from SPACEXTB	L where Lau	nch_Site like '	CCA%' LIMIT 5				
* sql	lite:///r	my_datal.db							
Date	Time (UTC)	Booster_Version	Launch_Site	Payload	PAYLOAD_MASSKG_	Orbit	Customer	Mission_Outcome	Landing _Outcome
04- 06- 2010	18:45:00	F9 v1.0 B0003	CCAFS LC- 40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX	Success	Failure (parachute)
08- 12- 2010	15:43:00	F9 v1.0 B0004	CCAFS LC- 40	Dragon demo flight C1, two CubeSats, barrel of Brouere cheese	0	LEO (ISS)	NASA (COTS) NRO	Success	Failure (parachute)
22- 05- 2012	07:44:00	F9 v1.0 B0005	CCAFS LC- 40	Dragon demo flight C2	525	LEO (ISS)	NASA (COTS)	Success	No attemp
08- 10- 2012	00:35:00	F9 v1.0 B0006	CCAFS LC- 40	SpaceX CRS-1	500	LEO (ISS)	NASA (CRS)	Success	No attemp
01- 03- 2013	15:10:00	F9 v1.0 B0007	CCAFS LC- 40	SpaceX CRS-2	677	LEO (ISS)	NASA (CRS)	Success	No attemp

**Explanation**: these 5 launches happened in LEO orbit, and four of them were from customer NASA.

#### **Total Payload Mass**

```
[9] %sql select sum(PAYLOAD_MASS__KG_) from SPACEXTBL where Customer like 'NASA%'
    * sqlite://my_datal.db
    Done.
    sum(PAYLOAD_MASS__KG_)
    99980
```

**Explanation**: The total payload carried by boosters from NASA is **99980**.

## Average Payload Mass by F9 v1.1

**Explanation**: the average payload mass carried by booster version F9 v1.1 is **2534.67**.

# First Successful Ground Landing Date

```
*sql select min(Date) from SPACEXTBL where "Landing _Outcome" = "Success (ground pad)"

* sqlite://my_datal.db
Done.
min(Date)

01-05-2017
```

**Explanation**: the first successful landing outcome on ground pad is **01-05-2017**.

#### Successful Drone Ship Landing with Payload between 4000 and 6000

**Explanation**: names of boosters which have successfully landed on drone ship and had payload mass greater than 4000 but less than 6000

- F9 FT B1022
- F9 FT B1026
- F9 FT B1021.2
- F9 FT B1031.2

```
%%sql
select Booster Version from SPACEXTBL
where "Landing Outcome" = "Success (drone ship)"
     and PAYLOAD MASS KG >4000
     and PAYLOAD MASS KG < 6000
 * sqlite:///my datal.db
Done.
Booster_Version
   F9 FT B1022
   F9 FT B1026
  F9 FT B1021.2
  F9 FT B1031.2
```

#### Total Number of Successful and Failure Mission Outcomes

#### **Explanation**:

- the total number of successful mission outcomes is 100
- the total number of failure mission outcomes is 1

```
[10] %%sql
     select count(*) from SPACEXTBL
     where "Mission Outcome" like "Success%"
     * sqlite:///my datal.db
     Done.
     count(*)
     100
[11] %%sql
     select count(*) from SPACEXTBL
     where "Mission Outcome" like "Failure%"
      * sqlite:///my datal.db
     Done.
     count(*)
```

# **Boosters Carried Maximum Payload**

**Names** of the booster which have carried the maximum payload mass:

F9 B5 B1048.4 F9 B5 B1049.4 F9 B5 B1051.3 F9 B5 B1056.4 F9 B5 B1048.5 F9 B5 B1051.4 F9 B5 B1049.5 F9 B5 B1060.2 F9 B5 B1058.3 F9 B5 B1051.6 F9 B5 B1060.3 F9 B5 B1049.7

```
**sql
select Booster Version from SPACEXTBL
where PAYLOAD MASS KG = (select max(PAYLOAD MASS KG ) from SPACEXTBL)
 * sqlite:///my datal.db
Done.
Booster_Version
  F9 B5 B1048.4
  F9 B5 B1049.4
  F9 B5 B1051.3
  F9 B5 B1056.4
  F9 B5 B1048.5
  F9 B5 B1051.4
  F9 B5 B1049.5
  F9 B5 B1060.2
  F9 B5 B1058.3
  F9 B5 B1051.6
  F9 B5 B1060.3
  F9 B5 B1049.7
```

#### 2015 Launch Records

Failed landing\_outcomes in drone ship, their booster versions, and launch site names for in year 2015:

Month	Booster_Version	Launch_Site
01	F9 v1.1 B1012	CCAFS LC-40
04	F9 v1.1 B1015	CCAFS LC-40

#### Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Rank the count of landing outcomes between the date 2010-06-04 and 2017-03-20:

Landing _Outcome	landings
Success	20
No attempt	10
Success (drone ship)	8
Success (ground pad)	6
Failure (drone ship)	4
Controlled (ocean)	3
Failure	3
Failure (parachute)	2
No attempt	1

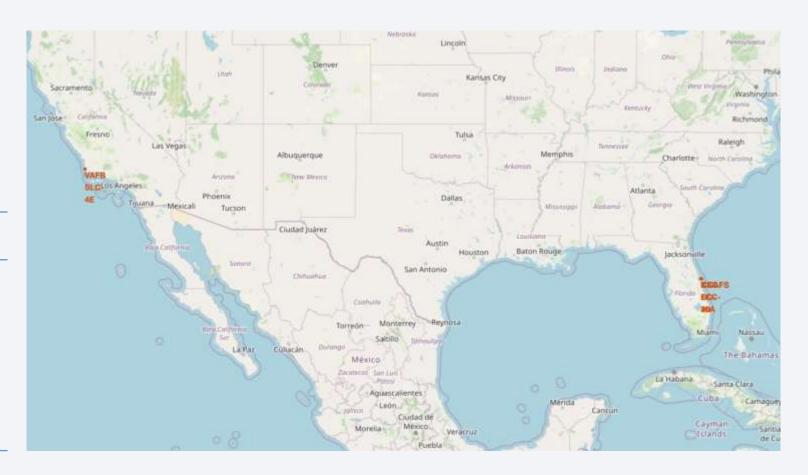

```
%%sql
select "Landing Outcome",
    count("Landing Outcome") as landings
from SPACEXTBL
where Date >= "04-06-2010" and Date <= "20-03-2017"
group by "Landing Outcome"
order by landings desc
 * sqlite:///my datal.db
Done.
Landing _Outcome landings
Success
                  20
No attempt
                  10
Success (drone ship) 8
Success (ground pad) 6
Failure (drone ship)
Controlled (ocean)
                  3
Failure
Failure (parachute)
No attempt
```

# Locations of Launch Sites on Maps

- Three in the east
- One in the west
- All in the south

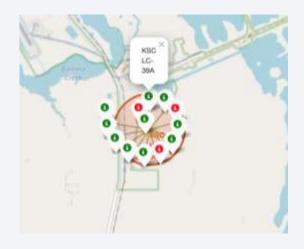

Launch Site	Lat	Long	
CCAFS LC-40	28.56230197	-80.57735648	
CCAFS SLC-40	28.56319718	-80.57682003	
KSC LC-39A	28.57325457	-80.64689529	
VAFB SLC-4E	34.63283416	-120.6107455	

# Display Launch Outcome by Color

From the color labels, we can easily see

- KSC LC-39A has a rather higher success rate
- Whereas CCAFS LC-40 and CCAFS SLC-40 have much lower rate

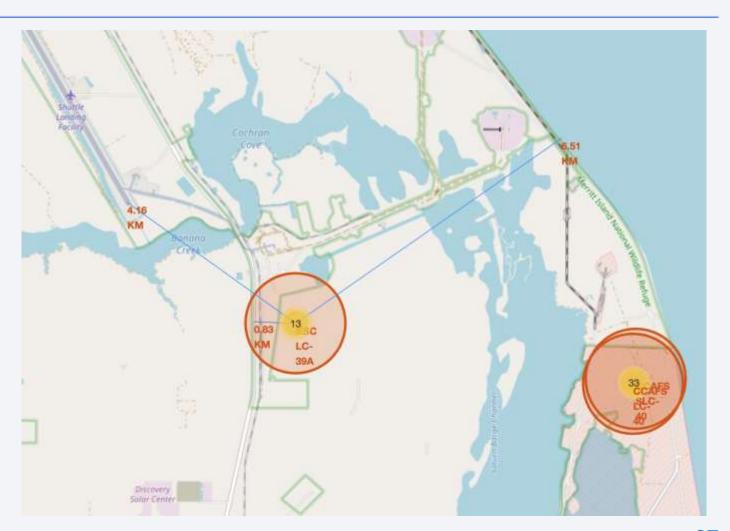

### Show Distance to Proximities

- ❖ The distance from KSC LC-39A to the nearest shuttle landing facility is about 4.16 km.
- ❖ The distance from KSC LC-39A to the nearest highway is less than 1 km.
- ❖ The distance from KSC LC-39A to the coastline is around 6.5 km.

### Total Success Launches for All Sites

#### Total Success Launches for All Sites is

• CCAFS LC-40: 29.2%

• VAFB SLC-4E: 16.7%

• KSC LC-39A: 41.7%

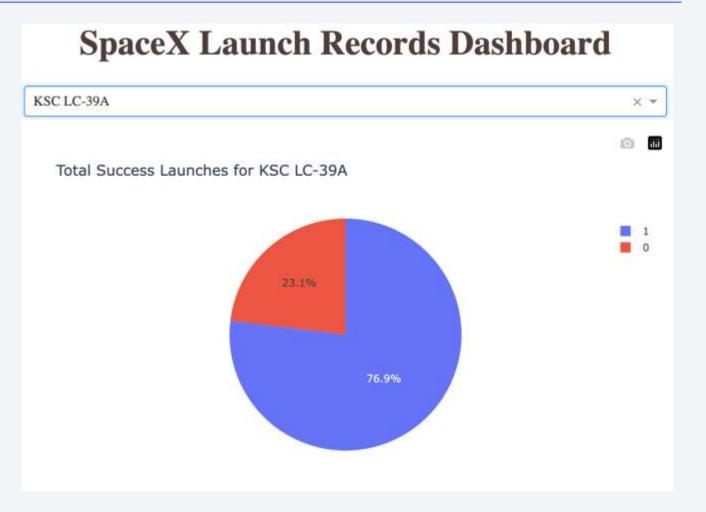

• CCAFS SLC-40: 12.5%

### Success Ratio for KSC LC-39A

The launch site with highest launch success ratio is **KSC LC-39A**.

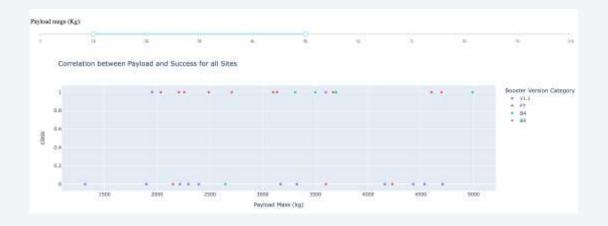

It has a success rate of 76.9%.

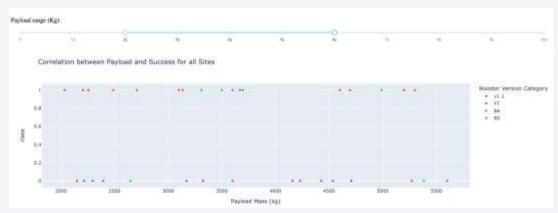

## Correlation Between Payload and Success

- □ Payload range in [3000, 4000] has the largest success rate.
- Booster version of **FT** has the largest success rate.

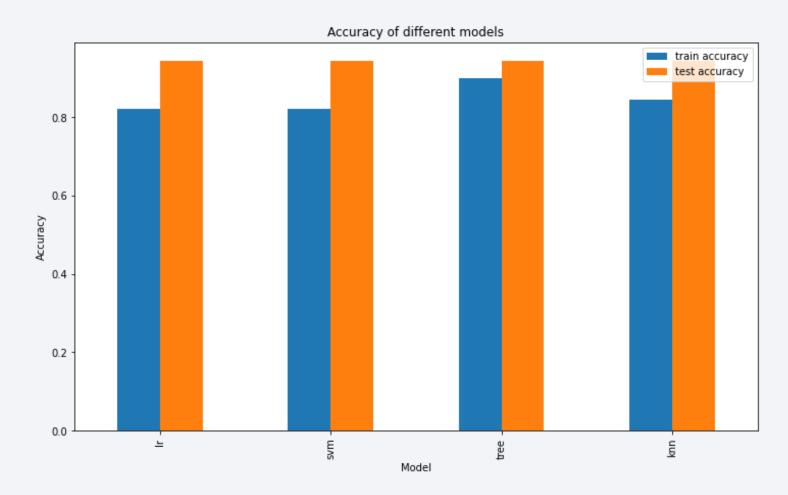

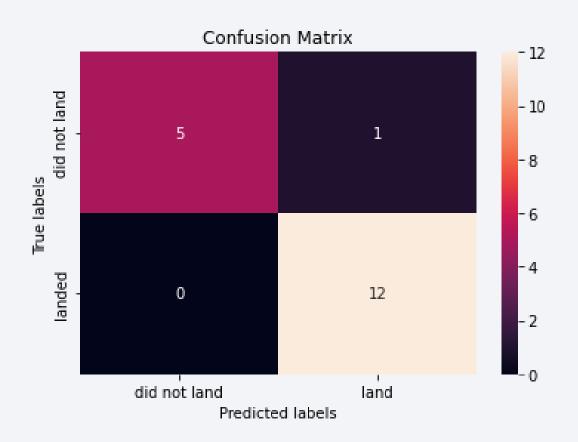

## Classification Accuracy

- Decision Tree model has the highest classification accuracy
- training accuracy 0.9, testing accuracy 0.94
- Parameter: {'criterion':
   'gini', 'max\_depth': 8,
   'max\_features': 'auto',
   'min\_samples\_leaf': 2,
   'min\_samples\_split': 10,
   'splitter': 'random'}

### **Confusion Matrix**

- ☐ Decision Tree model can distinguish between the different classes.
- ☐ The major problem is **false positives**.

#### Conclusions

- The dataset has 90 rows of data, with 83 columns. With 80/20 split, we have 72 rows of training data and 18 rows of testing data.
- And enhanced by GridSearchCV, we trained four models which have all best performance on test data set.
- Of these models, we can choose Decision Tree as our best model for predicting landing outcome of rocket.
- By the decision tree, we might have some problem with false positives which probably will impact our estimation of next bid for rocket launch.

## Pitfalls in Model Training

- ☐ The dataset only has 90 rows of data, but with 83 columns.
- With 80/20 split, we only have 72 records of training data.
- We have more features than samples! In this case, training model will lead to some unwanted results, such as overfitting.
- □ And we only have 18 test samples. Too few to find out problems.

	FlightNumber	PayloadMass	Flights	Block	ReusedCount	Orbit_ES- L1		
0	1.0	6104.959412	1.0	1.0	0.0	0.0		
1	2.0	525.000000	1.0	1.0	0.0	0.0		
2	3.0	677.000000	1.0	1.0	0.0	0.0		
3	4.0	500.000000	1.0	1.0	0.0	0.0		
4	5.0	3170.000000	1.0	1.0	0.0	0.0		
***				2444	****	***		
85	86.0	15400.000000	2.0	5.0	2.0	0.0		
86	87.0	15400.000000	3.0	5.0	2.0	0.0		
87	88.0	15400.000000	6.0	5.0	5.0	0.0		
88	89.0	15400.000000	3.0	5.0	2.0	0.0		
89	90.0	3681.000000	1.0	5.0	0.0	0.0		
90 rows × 83 columns								

# Pitfalls in Model Training (continued)

- ☐ How to handle this issue?
- ☐ Get more data, or add regularization, or dimension reduction
- May have a try: since in the EDA we have found some correlation between some variables, maybe we can just get rid of some unimportant columns.
- ☐ Try **PCA** to reduce dimension.

	FlightNumber	PayloadMass	Flights	Block	ReusedCount	Orbit_ES- L1		
0	1.0	6104.959412	1.0	1.0	0.0	0.0		
1	2.0	525.000000	1.0	1.0	0.0	0.0		
2	3.0	677.000000	1.0	1.0	0.0	0.0		
3	4.0	500.000000	1.0	1.0	0.0	0.0		
4	5.0	3170.000000	1.0	1.0	0.0	0.0
